ABSTRACT OF THE DISCLOSURE

A print server system where a user can select a spooler of a server or that of a client from which a stored image is to be print-outputted. Clients 12, 14 and 15 respectively have a first storage in which an image for which the client requested printing is stored. All the images for which printing have been requested from the clients are stored in a second storage in a server 16 which manages a printer 18. Upon actual print operation, a user designates one of the storages from which the stored image is to be transmitted to the printer, in accordance with a displayed screen image.
